

LLM Regression Tests — Simple Report

2026-03-17 12:24

What this report is

A quick, human-readable summary of the LLM regression tests we added to prevent prompt and output-contract regressions without calling Claude in CI.

What we tested

- Planner prompt contract: ensures the critical rule “tool_params MUST include dataset_id” stays present (prevents dataset_name/filename bugs).
- System prompt structure: ensures key sections remain (Available Data / Analysis So Far / Available Specialists).
- Synthesis prompt contract: ensures placeholders are forbidden and SQL formatting rules remain.
- Planner parsing contract: ensures representative JSON plans still parse into executable steps.

Test results

Suite	Result
LLM regression tests (offline)	5 passed
Full backend test suite	764 passed

What this protects us from

Accidental prompt edits reintroducing: (1) wrong dataset identifier usage, (2) template placeholders like “your_table_name”, (3) malformed plan JSON that breaks planning.

What is NOT covered yet

True live-output quality regression from Anthropic (non-deterministic). Next step would be record/replay “cassettes” or nightly live checks.
